Chapter 1

Namespace Index

1.1 Package List

Here are the packages with brief descriptions (if available):

DefaultNamespace	11
GameManager	11
MovementPatterns	11
PathCreation	12
PathCreation.Examples	12
PathCreation.Utility	12
PathCreationEditor	12
PlayerScripts	12
Serialization	13
Spawnables	13
Spawnables.EnemyScripts	13
Spawnables.Pickups	13
Spawnables.Weapons	14
Tools	14
Tymski	14
UI	14
UI.Menus	15
VFX	15

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

BezierPath	17
BombController	21
CameraShake	23
ComponentUtils	25
Controls	26
CubicBezierUtility	27
DamageFlash	29
DespawnCollider	30
EnemySpawner	33
Entity	34
Enemy	31
Pickup	62
MultiplierPickup	52
Projectile	72
FadeCanvas	36
GameManager	39
GameObjectEvent	41
GameState	43
GameOverState	42
PausedState	61
PlayingState	71
GameStateEvent	44
IShootable	45
BulletSpawner	22
Lazer	46
Enemy.LootDrop	48
MenuScreen	49
MovementPattern	50
ChasingMP	24
FollowPath	38
LinearMP	47
OrbitingMP	57
SinusoidMP	79
ObjectPool	53

ObjectPoolManager	55
PanCamera	58
PathCreatorData	59
PathEditor	60
Player	63
PlayerHitbox	65
PlayerStatus	67
Pickup.Reward	73
SaveSystem	74
SceneReference	76
ScoreData	77
Spin	80
TextDisplay	81
UIBar	82
VertexPath	84
Weapon	87

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

BezierPath	17
BombController	
Defines effects of deploying a bomb by player. The bomb deals gradual damage to all enemies and destroys projectiles for specified amount of time. The damage is dealt only during frames called damage ticks	21
BulletSpawner	
Spawns a specified projectile when shot either by the player or an enemy	22
CameraShake	
Shakes the camera violently, by displacing it rapidly over time	23
ChasingMP	
Entity chases a target for a set amount of time and then continues in a straight line	24
ComponentUtils	
A collection of utilities for working with Components	25
Controls	
Listens to the Unity's Input Manager and triggers events based on the input	26
CubicBezierUtility	27
DamageFlash	
Changes opacity of the tint material repeatedly to create a flashing effect	29
DespawnCollider	
Border collider that despawns objects that leave its area	30
Enemy	
Defininf characteristics of an enemy entity	31
EnemySpawner	
Repeatedly spawns specified enemies at a given interval	33
Entity	
An object that can be spawned from the ObjectPool and moved by the MovementPattern class	34
FadeCanvas	
Changes the alpha of a canvas to either 0 or 1 over time	36
FollowPath	
Utilizes PathCreator tool created by Sebastian Lague. Traces a path and moves along it	38
GameManager	
A state machine that controls the flow of the gameplay	39
GameObjectEvent	
Unity Event with GameObject parameter	41
GameOverState	
State reached upon losing all health	42

GameState	A state governed by the GameManager	43
GameStateEvent	Unity Event with GameState parameter	44
IShootable	Contract for entities activated by a weapon, able to hurt either enemies or the player	45
Lazer	A lazer beam damaging the player or entities by shooting raycasts, visualized by a LineRenderer. The lazer has 3 phases: Cooldown, Telegraph and Release. The beam deals damage only during the Release phase	46
LinearMP	Moves along a straight line	47
Enemy.LootDrop	Described possible loot drops from the enemy	48
MenuScreen	A menu screen's functionality	49
MovementPattern	Defines calculations for the position of an entity in the next frame based on its properties	50
MultiplierPickup	Grabbing this pickup increases the score multiplier. The score multiplier is reset by taking damage or by letting the pickup leave the playfield	52
ObjectPool	A set of pre-instantiated entities of a specified prefab that can be spawned and despawned by the ObjectPoolManager	53
ObjectPoolManager	Manages spawning and despawning entities from the assigned ObjectPools	55
OrbitingMP	Forms a circular orbit around targeted object	57
PanCamera	Smoothly pans the camera to a target position	58
PathCreatorData	Stores state data for the path creator editor	59
PathEditor	Editor class for the creation of Bezier and Vertex paths	60
PausedState	State reached pressing the pause button	61
Pickup	Entity increasing player's resources when picked up	62
Player	Controls player's movement and responses to his actions	63
PlayerHitbox	Takes responsibility and responses to being hit by enemy objects	65
PlayerStatus	Records state of player's resources and provides methods to change them	67
PlayingState	Default state of the level, when gameplay occurs	71
Projectile	An entity whose purpose is to deal damage to enemies or the player	72
Pickup.Reward	Resources gained by touching the pickup	73
SaveSystem	System for saving and loading object data on local machine	74
SceneReference	A wrapper that provides the means to safely serialize Scene Asset References	76
ScoreData	Serializable data of highest achieved scores	77

SinusoidMP	Produces and follows a sine wave shaped path. The sine wave can be rotated by specifying the axis of oscillation	79
Spin	Rotates the object each frame	80
TextDisplay	Tracks a PlayerStatus resource and displays it as formatted text	81
UIBar	A bar shown during gameplay that displays a resource	82
VertexPath	84
Weapon	An object responsible for timing and spawning projectiles or other IShootables	87

Chapter 4

Chapter 5

Namespace Documentation

5.1 DefaultNamespace Namespace Reference

5.2 GameManager Namespace Reference

Classes

- class [GameManager](#)
A state machine that controls the flow of the gameplay.
- class [GameOverState](#)
State reached upon losing all health.
- class [GameState](#)
A state governed by the [GameManager](#).
- class [PausedState](#)
State reached pressing the pause button.
- class [PlayingState](#)
Default state of the level, when gameplay occurs.

5.3 MovementPatterns Namespace Reference

Classes

- class [ChasingMP](#)
Entity chases a target for a set amount of time and then continues in a straight line.
- class [FollowPath](#)
Utilizes PathCreator tool created by Sebastian Lague. Traces a path and moves along it.
- class [LinearMP](#)
Moves along a straight line.
- class [MovementPattern](#)
Defines calculations for the position of an entity in the next frame based on its properties.
- class [OrbitingMP](#)
Forms a circular orbit around targeted object.
- class [SinusoidMP](#)
Produces and follows a sine wave shaped path. The sine wave can be rotated by specifying the axis of oscillation.

5.4 PathCreation Namespace Reference

Classes

- class [BezierPath](#)
- class [PathCreatorData](#)
Stores state data for the path creator editor.
- class [VertexPath](#)

5.5 PathCreation.Examples Namespace Reference

5.6 PathCreation.Utility Namespace Reference

Classes

- class [CubicBezierUtility](#)

5.7 PathCreationEditor Namespace Reference

Classes

- class [PathEditor](#)
Editor class for the creation of Bezier and Vertex paths.

5.8 PlayerScripts Namespace Reference

Classes

- class [BombController](#)
Defines effects of deploying a bomb by player. The bomb deals gradual damage to all enemies and destroys projectiles for specified amount of time. The damage is dealt only during frames called damage ticks.
- class [Controls](#)
Listens to the Unity's Input Manager and triggers events based on the input.
- class [Player](#)
Controls player's movement and responses to his actions.
- class [PlayerHitbox](#)
Takes responsibility and responses to being hit by enemy objects.
- class [PlayerStatus](#)
Records state of player's resources and provides methods to change them.

5.9 Serialization Namespace Reference

Classes

- class [SaveSystem](#)
System for saving and loading object data on local machine.
- class [ScoreData](#)
Serializable data of highest achieved scores.

5.10 Spawnables Namespace Reference

Classes

- class [DespawnCollider](#)
Border collider that despawns objects that leave its area.
- class [Entity](#)
An object that can be spawned from the ObjectPool and moved by the MovementPattern class.
- class [ObjectPool](#)
A set of pre-instantiated entities of a specified prefab that can be spawned and despawned by the ObjectPoolManager.
- class [ObjectPoolManager](#)
Manages spawning and despawning entities from the assigned ObjectPools.
- class [Spin](#)
Rotates the object each frame.

5.11 Spawnables.EnemyScripts Namespace Reference

Classes

- class [Enemy](#)
Defining characteristics of an enemy entity.
- class [EnemySpawner](#)
Repeatedly spawns specified enemies at a given interval.

5.12 Spawnables.Pickups Namespace Reference

Classes

- class [MultiplierPickup](#)
Grabbing this pickup increases the score multiplier. The score multiplier is reset by taking damage or by letting the pickup leave the playfield.
- class [Pickup](#)
Entity increasing player's resources when picked up.

5.13 Spawnables.Weapons Namespace Reference

Classes

- class [BulletSpawner](#)
Spawns a specified projectile when shot either by the player or an enemy.
- interface [IShootable](#)
Contract for entities activated by a weapon, able to hurt either enemies or the player.
- class [Lazer](#)
A lazer beam damaging the player or entities by shooting raycasts, visualized by a LineRenderer. The lazer has 3 phases: Cooldown, Telegraph and Release. The beam deals damage only during the Release phase.
- class [Projectile](#)
An entity whose purpose is to deal damage to enemies or the player.
- class [Weapon](#)
An object responsible for timing and spawning projectiles or other IShootables.

5.14 Tools Namespace Reference

Classes

- class [ComponentUtils](#)
A collection of utilities for working with Components.
- class [GameObjectEvent](#)
Unity Event with GameObject parameter.
- class [GameStateEvent](#)
Unity Event with GameState parameter.

5.15 Tyski Namespace Reference

Classes

- class [SceneReference](#)
A wrapper that provides the means to safely serialize Scene Asset References.

5.16 UI Namespace Reference

Classes

- class [MenuScreen](#)
A menu screen's functionality.
- class [TextDisplay](#)
Tracks a PlayerStatus resource and displays it as formatted text.
- class [UIBar](#)
A bar shown during gameplay that displays a resource.

5.17 UI.Menu Namespace Reference

5.18 VFX Namespace Reference

Classes

- class [CameraShake](#)
Shakes the camera violently, by displacing it rapidly over time.
- class [DamageFlash](#)
Changes opacity of the tint material repeatedly to create a flashing effect.
- class [FadeCanvas](#)
Changes the alpha of a canvas to either 0 or 1 over time.
- class [PanCamera](#)
Smoothly pans the camera to a target position.

Chapter 6

Class Documentation

6.1 BezierPath Class Reference

Public Member Functions

- [BezierPath](#) (Vector3 centre, bool isClosed=false, PathSpace space=PathSpace.xyz)
Creates a two-anchor path centred around the given centre point.
- [BezierPath](#) (IEnumerable< Vector3 > points, bool isClosed=false, PathSpace space=PathSpace.xyz)
Creates a path from the supplied 3D points.
- [BezierPath](#) (IEnumerable< Vector2 > transforms, bool isClosed=false, PathSpace space=PathSpace.xy)
Creates a path from the positions of the supplied 2D points.
- [BezierPath](#) (IEnumerable< Transform > transforms, bool isClosed=false, PathSpace space=PathSpace.xy)
Creates a path from the positions of the supplied transforms.
- [BezierPath](#) (IEnumerable< Vector2 > points, PathSpace space=PathSpace.xyz, bool isClosed=false)
Creates a path from the supplied 2D points.
- Vector3 **GetPoint** (int i)
Get world space position of point.
- void **SetPoint** (int i, Vector3 localPosition, bool suppressPathModifiedEvent=false)
Get world space position of point.
- void **AddSegmentToEnd** (Vector3 anchorPos)
Add new anchor point to end of the path.
- void **AddSegmentToStart** (Vector3 anchorPos)
Add new anchor point to start of the path.
- void **SplitSegment** (Vector3 anchorPos, int segmentIndex, float splitTime)
Insert new anchor point at given position. Automatically place control points around it so as to keep shape of curve the same.
- void **DeleteSegment** (int anchorIndex)
Delete the anchor point at given index, as well as its associated control points.
- Vector3[] **GetPointsInSegment** (int segmentIndex)
Returns an array of the 4 points making up the segment (anchor1, control1, control2, anchor2)
- void **MovePoint** (int i, Vector3 pointPos, bool suppressPathModifiedEvent=false)
Move an existing point to a new position.
- Bounds **CalculateBoundsWithTransform** (Transform transform)
Update the bounding box of the path.
- float **GetAnchorNormalAngle** (int anchorIndex)
Get the desired angle of the normal vector at a particular anchor (only relevant for paths in 3D space)
- void **SetAnchorNormalAngle** (int anchorIndex, float angle)
Set the desired angle of the normal vector at a particular anchor (only relevant for paths in 3D space)
- void **ResetNormalAngles** ()
Reset global and anchor normal angles to 0.

Properties

- **Vector3 this[int i]** [get]
Get world space position of point.
- **int NumPoints** [get]
Total number of points in the path (anchors and controls)
- **int NumAnchorPoints** [get]
Number of anchor points making up the path.
- **int NumSegments** [get]
Number of bezier curves making up this path.
- **PathSpace Space** [get, set]
- **bool IsClosed** [get, set]
If closed, path will loop back from end point to start point.
- **ControlMode ControlPointMode** [get, set]
- **float AutoControlLength** [get, set]
When using automatic control point placement, this value scales how far apart controls are placed.
- **bool FlipNormals** [get, set]
Flip the normal vectors 180 degrees.
- **float GlobalNormalsAngle** [get, set]
Global angle that all normal vectors are rotated by (only relevant for paths in 3D space)
- **Bounds PathBounds** [get]
Bounding box containing the path.

Private Member Functions

- **void UpdateBounds ()**
Update the bounding box of the path.
- **void AutoSetAllAffectedControlPoints (int updatedAnchorIndex)**
Determines good positions (for a smooth path) for the control points affected by a moved/inserted anchor point.
- **void AutoSetAllControlPoints ()**
Determines good positions (for a smooth path) for all control points.
- **void AutoSetAnchorControlPoints (int anchorIndex)**
Calculates good positions (to result in smooth path) for the controls around specified anchor.
- **void AutoSetStartAndEndControls ()**
Determines good positions (for a smooth path) for the control points at the start and end of a path.
- **void UpdateToNewPathSpace (PathSpace previousSpace)**
- **void UpdateClosedState ()**
Add/remove the extra 2 controls required for a closed path.
- **int LoopIndex (int i)**
Loop index around to start/end of points array if out of bounds (useful when working with closed paths)

6.1.1 Detailed Description

A bezier path is a path made by stitching together any number of (cubic) bezier curves. A single cubic bezier curve is defined by 4 points: anchor1, control1, control2, anchor2. The curve moves between the 2 anchors, and the shape of the curve is affected by the positions of the 2 control points. When two curves are stitched together, they share an anchor point (end anchor of curve 1 = start anchor of curve 2). So while one curve alone consists of 4 points, two curves are defined by 7 unique points. Apart from storing the points, this class also provides methods for working with the path. For example, adding, inserting, and deleting points.

Definition at line 18 of file [BezierPath.cs](#).

6.1.2 Constructor & Destructor Documentation

6.1.2.1 BezierPath() [1/5]

```
BezierPath (
    Vector3 centre,
    bool isClosed = false,
    PathSpace space = PathSpace::xyz )
```

param name="isClosed"> Should the end point connect back to the start point?

param name="space"> Determines if the path is in 3d space, or clamped to the xy/xz plane

Definition at line 54 of file [BezierPath.cs](#).

6.1.2.2 BezierPath() [2/5]

```
BezierPath (
    IEnumerable< Vector3 > points,
    bool isClosed = false,
    PathSpace space = PathSpace::xyz )
```

param name="points"> List or array of points to create the path from.

param name="isClosed"> Should the end point connect back to the start point?

param name="space"> Determines if the path is in 3d space, or clamped to the xy/xz plane

Definition at line 77 of file [BezierPath.cs](#).

6.1.2.3 BezierPath() [3/5]

```
BezierPath (
    IEnumerable< Vector2 > transforms,
    bool isClosed = false,
    PathSpace space = PathSpace::xy )
```

param name="transforms"> List or array of transforms to create the path from.

param name="isClosed"> Should the end point connect back to the start point?

param name="space"> Determines if the path is in 3d space, or clamped to the xy/xz plane

Definition at line 101 of file [BezierPath.cs](#).

6.1.2.4 BezierPath() [4/5]

```
BezierPath (
    IEnumerable< Transform > transforms,
    bool isClosed = false,
    PathSpace space = PathSpace::xy )
```

param name="transforms"> List or array of transforms to create the path from.

param name="isClosed"> Should the end point connect back to the start point?

param name="space"> Determines if the path is in 3d space, or clamped to the xy/xz plane

Definition at line 108 of file [BezierPath.cs](#).

6.1.2.5 BezierPath() [5/5]

```
BezierPath (
    IEnumerable< Vector2 > points,
    PathSpace space = PathSpace::xyz,
    bool isClosed = false )
```

param name="points"> List or array of 2d points to create the path from.

param name="isClosed"> Should the end point connect back to the start point?

param name="pathSpace"> Determines if the path is in 3d space, or clamped to the xy/xz plane

Definition at line 115 of file [BezierPath.cs](#).

6.1.3 Member Function Documentation

6.1.3.1 UpdateToNewPathSpace()

```
void UpdateToNewPathSpace (
    PathSpace previousSpace ) [private]
```

Update point positions for new path space (for example, if changing from xy to xz path, y and z axes will be swapped so the path keeps its shape in the new space)

Definition at line 597 of file [BezierPath.cs](#).

6.1.4 Property Documentation

6.1.4.1 Space

```
PathSpace Space [get], [set]
```

Path can exist in 3D (xyz), 2D (xy), or Top-Down (xz) space In xy or xz space, points will be clamped to that plane (so in a 2D path, for example, points will always be at 0 on z axis)

Definition at line 165 of file [BezierPath.cs](#).

6.1.4.2 ControlPointMode

```
ControlMode ControlPointMode [get], [set]
```

The control mode determines the behaviour of control points. Possible modes are: Aligned = controls stay in straight line around their anchor Mirrored = controls stay in straight, equidistant line around their anchor Free = no constraints (use this if sharp corners are needed) Automatic = controls placed automatically to try make the path smooth

Definition at line 197 of file [BezierPath.cs](#).

The documentation for this class was generated from the following file:

- Tools/PathCreator/Core/Runtime/Objects/BezierPath.cs

6.2 BombController Class Reference

Defines effects of deploying a bomb by player. The bomb deals gradual damage to all enemies and destroys projectiles for specified amount of time. The damage is dealt only during frames called damage ticks.

Inherits MonoBehaviour.

Public Member Functions

- IEnumerator **DeployBomb** ()
Coroutine that deals damage and destroys projectiles on each damage tick.

Public Attributes

- float **initialDamage**
Damage dealt by the bomb at the beginning of its effect.
- AnimationCurve **damageCurve**
Damage multiplier of the bomb in the specified time.
- float **damageTickInterval**
Time between damage ticks.
- UnityEvent **onBombDeployed**
Event invoked when the bomb is deployed by player.
- UnityEvent **onBombEffectEnd**
Event invoked when the bomb stops dealing any more damage.

Events

- static Action< int > **OnBombDamageTick**
Event invoked every time the bomb deals damage.

6.2.1 Detailed Description

Definition at line 12 of file [BombController.cs](#).

The documentation for this class was generated from the following file:

- Scripts/PlayerScripts/BombController.cs

6.3 BulletSpawner Class Reference

Spawns a specified projectile when shot either by the player or an enemy.

Inheritance diagram for BulletSpawner:

Public Member Functions

- void **OnShoot** ()
Spawn a projectile at the spawner's position and rotation.

Public Attributes

- GameObject **projectile**
Projectile to spawn.

6.3.1 Detailed Description

Definition at line 8 of file [BulletSpawner.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Weapons/Shootables/BulletSpawner.cs

6.4 CameraShake Class Reference

Shakes the camera violently, by displacing it rapidly over time.

Inherits MonoBehaviour.

Public Member Functions

- void **ShakeCamera** ()
Starts shaking the camera violently.

Public Attributes

- Camera **camera**
Camera to shake.
- AnimationCurve **shakeCurve**
Intensity multiplier of the shake over time.
- float **intensity**
Distance the camera will be displaced from its original position.
- float **refreshRate**
Amount of displacements per second.

6.4.1 Detailed Description

Definition at line 9 of file [CameraShake.cs](#).

The documentation for this class was generated from the following file:

- Scripts/VFX/CameraShake.cs

6.5 ChasingMP Class Reference

Entity chases a target for a set amount of time and then continues in a straight line.

Inheritance diagram for ChasingMP:

Private Attributes

- GameObject **target**
The target being chased.
- float **lockOnTime**
Time before the entity starts chasing the target. Use to avoid unrealistic behavior upon spawning.
- float **chaseTime**
Amount of time the entity chases the target before continuing in a straight line.
- float **attractionRate**
Rate at which the entity rotates towards the target.
- float **speed**
Distance traveled after one second.
- float **acceleration**
Rate of change of speed.

Additional Inherited Members

Public Member Functions inherited from [MovementPattern](#)

- void [Initialize](#) ([Entity](#) entity)
Sets parameters of the movement pattern based on the entity's state.
- Vector3 [GetNextPosition](#) ([Entity](#) entity)
Calculates the position of the entity in the next frame.

6.5.1 Detailed Description

Definition at line 9 of file [ChasingMP.cs](#).

The documentation for this class was generated from the following file:

- Scripts/MovementPatterns/ChasingMP.cs

6.6 ComponentUtils Class Reference

A collection of utilities for working with Components.

Static Public Member Functions

- static T [ReplaceComponent](#)< T > (T original, T replacement)
Overwrites the values of all fields of a component with the values of another component.

6.6.1 Detailed Description

Definition at line 9 of file [ComponentUtils.cs](#).

6.6.2 Member Function Documentation

6.6.2.1 ReplaceComponent< T >()

```
static T ReplaceComponent< T > (  
    T original,  
    T replacement ) [static]
```

Parameters

<i>original</i>	The overwritten component
<i>replacement</i>	The component with desired values

Template Parameters

<i>T</i>	Type of the component
----------	-----------------------

Returns

The original component with overwritten values

Type Constraints

T* : *Component

Definition at line 18 of file [ComponentUtils.cs](#).

The documentation for this class was generated from the following file:

- Tools/ComponentUtils.cs

6.7 Controls Class Reference

Listens to the Unity's Input Manager and triggers events based on the input.

Inherits MonoBehaviour.

Static Public Attributes

- static float **MoveHorizontal**
Value of the Input Manager's virtual horizontal axis (A/D)
- static float **MoveVertical**
Value of the Input Manager's virtual vertical axis (W/S)
- static bool **IsFocused**
True if the focus button is held down.

Events

- static Action **Action1**
Invoked when the primary action button is pressed (K/Z)
- static Action **Action1Release**
Invoked when the primary action button is released (K/Z)
- static Action **Action2**
Invoked when the secondary action button is pressed (L/X)
- static Action **Action2Release**
Invoked when the secondary action button is released (L/X)
- static Action **Submit**
Invoked when the submit button is pressed (Enter)
- static Action **SubmitRelease**
Invoked when the submit button is released (Enter)
- static Action **Cancel**
Invoked when the cancel button is pressed (Esc)
- static Action **CancelRelease**
Invoked when the cancel button is released (Esc)
- static EventHandler< float > **MovesUp**
Invoked when the vertical axis is moved upwards, with its value as a parameter.
- static EventHandler< float > **MovesDown**
Invoked when the vertical axis is moved downwards, with its value as a parameter.
- static EventHandler< float > **MovesLeft**
Invoked when the horizontal axis is moved left, with its value as a parameter.
- static EventHandler< float > **MovesRight**
Invoked when the horizontal axis is moved right, with its value as a parameter.

6.7.1 Detailed Description

Definition at line 9 of file [Controls.cs](#).

The documentation for this class was generated from the following file:

- Scripts/PlayerScripts/Controls.cs

6.8 CubicBezierUtility Class Reference

Static Public Member Functions

- static Vector3 **EvaluateCurve** (Vector3[] points, float t)
Returns point at time 't' (between 0 and 1) along bezier curve defined by 4 points (anchor_1, control_1, control_2, anchor_2)
- static Vector3 **EvaluateCurve** (Vector3 a1, Vector3 c1, Vector3 c2, Vector3 a2, float t)
Returns point at time 't' (between 0 and 1) along bezier curve defined by 4 points (anchor_1, control_1, control_2, anchor_2)
- static Vector3 **EvaluateCurveDerivative** (Vector3[] points, float t)
- static Vector3 **EvaluateCurveDerivative** (Vector3 a1, Vector3 c1, Vector3 c2, Vector3 a2, float t)
- static Vector3 **EvaluateCurveSecondDerivative** (Vector3[] points, float t)
Returns the second derivative of the curve at time 't'.
- static Vector3 **EvaluateCurveSecondDerivative** (Vector3 a1, Vector3 c1, Vector3 c2, Vector3 a2, float t)
Returns the second derivative of the curve at time 't'.
- static Vector3 **Normal** (Vector3[] points, float t)
Calculates the normal vector (vector perpendicular to the curve) at specified time.
- static Vector3 **Normal** (Vector3 a1, Vector3 c1, Vector3 c2, Vector3 a2, float t)
Calculates the normal vector (vector perpendicular to the curve) at specified time.
- static Vector3[][] **SplitCurve** (Vector3[] points, float t)
Splits curve into two curves at time t. Returns 2 arrays of 4 points.
- static List< float > **ExtremePointTimes** (Vector3 p0, Vector3 p1, Vector3 p2, Vector3 p3)
Times of stationary points on curve (points where derivative is zero on any axis)

6.8.1 Detailed Description

Collection of functions related to cubic bezier curves (a curve with a start and end 'anchor' point, and two 'control' points to define the shape of the curve between the anchors)

Definition at line 9 of file [CubicBezierUtility.cs](#).

6.8.2 Member Function Documentation

6.8.2.1 EvaluateCurveDerivative() [1/2]

```
static Vector3 EvaluateCurveDerivative (
    Vector3[] points,
    float t ) [static]
```

Returns a vector tangent to the point at time 't' This is the vector tangent to the curve at that point

Definition at line 24 of file [CubicBezierUtility.cs](#).

6.8.2.2 EvaluateCurveDerivative() [2/2]

```
static Vector3 EvaluateCurveDerivative (
    Vector3 a1,
    Vector3 c1,
    Vector3 c2,
    Vector3 a2,
    float t ) [static]
```

Calculates the derivative of the curve at time 't' This is the vector tangent to the curve at that point

Definition at line 30 of file [CubicBezierUtility.cs](#).

The documentation for this class was generated from the following file:

- Tools/PathCreator/Core/Runtime/Utility/CubicBezierUtility.cs

6.9 DamageFlash Class Reference

Changes opacity of the tint material repeatedly to create a flashing effect.

Inherits MonoBehaviour.

Public Member Functions

- void [StartFlashing](#) (GameObject projectile)
Starts the flashing effect.
- void **StopFlashing** ()
Stops the flashing effect.

Public Attributes

- AnimationCurve **intensityCurve**
Intensity of the tint over time.

6.9.1 Detailed Description

Definition at line 10 of file [DamageFlash.cs](#).

6.9.2 Member Function Documentation

6.9.2.1 StartFlashing()

```
void StartFlashing (  
    GameObject projectile )
```

Parameters

<i>projectile</i>	(Not yet implemented)
-------------------	-----------------------

Definition at line 48 of file [DamageFlash.cs](#).

The documentation for this class was generated from the following file:

- Scripts/VFX/DamageFlash.cs

6.10 DespawnCollider Class Reference

Border collider that despawns objects that leave its area.

Inherits MonoBehaviour.

6.10.1 Detailed Description

Definition at line 8 of file [DespawnCollider.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/DespawnCollider.cs

6.11 Enemy Class Reference

Defining characteristics of an enemy entity.

Inheritance diagram for Enemy:

Classes

- class [LootDrop](#)
Described possible loot drops from the enemy.

Public Attributes

- bool **tracksPlayer** = false
Whether the enemy rotates towards the player.
- int **maxHealth**
Maximum health of the enemy. Health at spawn.
- int **scoreReward**
Score reward for killing this enemy.
- List< [LootDrop](#) > **drops**
List of items that can be dropped on death.

Public Attributes inherited from [Entity](#)

- [MovementPattern](#) **movementPattern**
Movement pattern that determines the position of the entity in the next frame.
- string **SpawnKey**
A key to identify the entity among the ObjectPools.

Additional Inherited Members

Public Member Functions inherited from [Entity](#)

- void [SetMovementPattern](#) ([MovementPattern](#) newMovementPattern)
Changes the MovementPattern of the entity.
- void **StartMoving** ()
Tells the entity to start using its MovementPattern.
- void **StopMoving** ()
Tells the entity to stop using its MovementPattern.

Properties inherited from [Entity](#)

- float **LifeTime** [get]
Time passed since the entity was enabled.
- float **MPLifeTime** [get]
Time passed since the MovementPattern was last set.

6.11.1 Detailed Description

Definition at line 12 of file [Enemy.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/EnemyScripts/Enemy.cs

6.12 EnemySpawner Class Reference

Repeatedly spawns specified enemies at a given interval.

Inherits MonoBehaviour.

Public Attributes

- GameObject **prefab**
A prefab of the enemy to spawn.
- float **interval** = 1f
Time between spawns in seconds.
- int **maxCount**
Total amount of enemies spawned during the spawner's lifetime.

6.12.1 Detailed Description

Definition at line 8 of file [EnemySpawner.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/EnemyScripts/EnemySpawner.cs

6.13 Entity Class Reference

An object that can be spawned from the ObjectPool and moved by the MovementPattern class.

Inheritance diagram for Entity:

Public Member Functions

- void **SetMovementPattern** ([MovementPattern](#) newMovementPattern)
Changes the MovementPattern of the entity.
- void **StartMoving** ()
Tells the entity to start using its MovementPattern.
- void **StopMoving** ()
Tells the entity to stop using its MovementPattern.

Public Attributes

- [MovementPattern](#) **movementPattern**
Movement pattern that determines the position of the entity in the next frame.
- string **SpawnKey**
A key to identify the entity among the ObjectPools.

Properties

- float **LifeTime** [get]
Time passed since the entity was enabled.
- float **MPLifeTime** [get]
Time passed since the MovementPattern was last set.

6.13.1 Detailed Description

Definition at line 12 of file [Entity.cs](#).

6.13.2 Member Function Documentation

6.13.2.1 SetMovementPattern()

```

void SetMovementPattern (
    MovementPattern newMovementPattern )
  
```

Parameters

<i>newMovementPattern</i>	The new movement pattern
---------------------------	--------------------------

Definition at line 70 of file [Entity.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Entity.cs

6.14 FadeCanvas Class Reference

Changes the alpha of a canvas to either 0 or 1 over time.

Inherits MonoBehaviour.

Public Member Functions

- void [FadeIn](#) (float fadeInTime)
Changes the alpha of the canvas to 1 over time.
- void [FadeOut](#) (float fadeOutTime)
Changes the alpha of the canvas to 0 over time.

Public Attributes

- float **fadeInDelay**
Time before the FadeIn starts.
- float **fadeOutDelay**
Time before the FadeOut starts.

6.14.1 Detailed Description

Definition at line 10 of file [FadeCanvas.cs](#).

6.14.2 Member Function Documentation

6.14.2.1 FadeIn()

```
void FadeIn (
    float fadeInTime )
```

Parameters

<i>fadeInTime</i>	Time it takes to fully fade in
-------------------	--------------------------------

Definition at line 41 of file [FadeCanvas.cs](#).

6.14.2.2 FadeOut()

```
void FadeOut (
    float fadeOutTime )
```

Parameters

<i>fadeOutTime</i>	Time it takes to fully fade out
--------------------	---------------------------------

Definition at line 50 of file [FadeCanvas.cs](#).

The documentation for this class was generated from the following file:

- Scripts/VFX/FadeCanvas.cs

6.15 FollowPath Class Reference

Utilizes PathCreator tool created by Sebastian Lague. Traces a path and moves along it.

Inheritance diagram for FollowPath:

Private Attributes

- PathCreator **path**
Path to move along.
- float **speed** = 1
Distance travelled in one second.
- float **acceleration** = 0
Rate of change of speed.

Additional Inherited Members

Public Member Functions inherited from [MovementPattern](#)

- void [Initialize](#) ([Entity](#) entity)
Sets parameters of the movement pattern based on the entity's state.
- Vector3 [GetNextPosition](#) ([Entity](#) entity)
Calculates the position of the entity in the next frame.

6.15.1 Detailed Description

Definition at line 11 of file [FollowPath.cs](#).

The documentation for this class was generated from the following file:

- Scripts/MovementPatterns/FollowPath.cs

6.16 GameManager Class Reference

A state machine that controls the flow of the gameplay.

Inherits MonoBehaviour.

Public Member Functions

- void [ChangeState](#) ([GameState](#) newState)
Activates the given state and deactivates the current state.
- void [SaveAndQuit](#) (string playerName)
Saves the obtained score and returns to the main menu.

Public Attributes

- [GameState](#) **initialState**
State to set upon loading a scene.
- [SceneReference](#) **mainMenuScene**
A scene to return to upon quitting the gameplay.
- [GameStateEvent](#) **onStateChanged**
Event with GameState parameter that is invoked when the state of the game changes.

Static Public Attributes

- static [GameManager](#) **Instance**
Singleton instance of the [GameManager](#).

6.16.1 Detailed Description

Definition at line 14 of file [GameManager.cs](#).

6.16.2 Member Function Documentation

6.16.2.1 ChangeState()

```
void ChangeState (  
    GameState newState )
```

Parameters

<i>newState</i>	The newly activated state
-----------------	---------------------------

Definition at line 63 of file [GameManager.cs](#).

6.16.2.2 SaveAndQuit()

```
void SaveAndQuit (
    string playersName )
```

Parameters

<i>playersName</i>	Name of the player to save to the leaderboards
--------------------	--

Definition at line 76 of file [GameManager.cs](#).

The documentation for this class was generated from the following file:

- Scripts/GameManager/GameManager.cs

6.17 GameObjectEvent Class Reference

Unity Event with GameObject parameter.

Inherits `UnityEvent< GameObject >`.

6.17.1 Detailed Description

Definition at line 11 of file [CustomEvents.cs](#).

The documentation for this class was generated from the following file:

- `Tools/CustomEvents.cs`

6.18 GameState Class Reference

State reached upon losing all health.

Inheritance diagram for GameState:

Additional Inherited Members

Public Member Functions inherited from [GameState](#)

- void **ChangeToThisState** ()
Takes actions needed to define this state.
- void **LeaveThisState** ()
Undoes changes made by this state.

6.18.1 Detailed Description

Definition at line 9 of file [GameOverState.cs](#).

The documentation for this class was generated from the following file:

- Scripts/GameManager/States/GameOverState.cs

6.19 GameState Class Reference

A state governed by the [GameManager](#).

Inheritance diagram for GameState:

Public Member Functions

- void **ChangeToThisState** ()
Takes actions needed to define this state.
- void **LeaveThisState** ()
Undoes changes made by this state.

6.19.1 Detailed Description

Definition at line 8 of file [GameState.cs](#).

The documentation for this class was generated from the following file:

- Scripts/GameManager/GameState.cs

6.20 GameStateEvent Class Reference

Unity Event with GameState parameter.

Inherits `UnityEvent< GameState >`.

6.20.1 Detailed Description

Definition at line 16 of file [CustomEvents.cs](#).

The documentation for this class was generated from the following file:

- `Tools/CustomEvents.cs`

6.21 IShootable Interface Reference

Contract for entities activated by a weapon, able to hurt either enemies or the player.

Inheritance diagram for IShootable:

Public Member Functions

- void **OnShoot** ()
Called when the weapon is activated.

6.21.1 Detailed Description

Definition at line 6 of file [IShootable.cs](#).

The documentation for this interface was generated from the following file:

- Scripts/Spawnables/Weapons/Shootables/IShootable.cs

6.22 Lazer Class Reference

A lazer beam damaging the player or entities by shooting raycasts, visualized by a LineRenderer. The lazer has 3 phases: Cooldown, Telegraph and Release. The beam deals damage only during the Release phase.

Inheritance diagram for Lazer:

Public Member Functions

- void **OnShoot** ()
Called when the weapon is activated.

Public Attributes

- float **cooldown**
Duration of the Cooldown phase in seconds.
- float **telegraphDuration**
Duration of the Telegraph phase in seconds.
- float **releaseDuration**
Duration of the Release phase in seconds.
- Material **telegraphMaterial**
Material of the LineRenderer during the Telegraph phase.
- Material **releaseMaterial**
Material of the LineRenderer during the Release phase.
- float **telegraphWidth**
Width of the LineRenderer during the Telegraph phase.
- float **releaseWidth**
Width of the LineRenderer during the Release phase.

6.22.1 Detailed Description

Definition at line 12 of file [Lazer.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Weapons/Shootables/Lazer.cs

6.23 LinearMP Class Reference

Moves along a straight line.

Inheritance diagram for LinearMP:

Private Attributes

- float **speed**
Distance travelled in one second.
- float **acceleration**
Rate of change of speed.
- bool **followsRotation**
If true, the slope of the line is determined by the entity's rotation.
- float **directionInDegrees**
If followsRotation is false, this is the angle of the slope in degrees, where 0 is up.

Additional Inherited Members

Public Member Functions inherited from **MovementPattern**

- void **Initialize** (**Entity** entity)
Sets parameters of the movement pattern based on the entity's state.
- Vector3 **GetNextPosition** (**Entity** entity)
Calculates the position of the entity in the next frame.

6.23.1 Detailed Description

Definition at line 12 of file [LinearMP.cs](#).

The documentation for this class was generated from the following file:

- Scripts/MovementPatterns/LinearMP.cs

6.24 Enemy.LootDrop Class Reference

Described possible loot drops from the enemy.

Public Attributes

- GameObject **item**
Prefab of the item to be dropped.
- float **dropChance**
Chance of the item being dropped on death.
- int **maxDrops**
Max amount of items of this type to be dropped.

6.24.1 Detailed Description

Definition at line 20 of file [Enemy.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/EnemyScripts/Enemy.cs

6.25 MenuScreen Class Reference

A menu screen's functionality.

Inherits MonoBehaviour.

Inherited by CreditsScreen, GameOverScreen, Leaderboard, MainMenu, and PauseMenu.

Public Member Functions

- void **OpenMenu** ()
Sets the menu to be active and informs listeners.
- void **CloseMenu** ()
Informs listeners and wait for them to finish before deactivating the menu.

Public Attributes

- float **onCloseDelay** = 0.3f
Amount of time to wait before deactivating the menu, to let [VFX](#) finish playing.
- UnityEvent **menuLeftEvent**
Event invoked when the menu is closed.
- UnityEvent **menuOpenedEvent**
Event invoked when the menu is opened.

6.25.1 Detailed Description

Definition at line 10 of file [MenuScreen.cs](#).

The documentation for this class was generated from the following file:

- Scripts/UI/MenuScreen.cs

6.26 MovementPattern Class Reference

Defines calculations for the position of an entity in the next frame based on its properties.

Inheritance diagram for MovementPattern:

Public Member Functions

- void [Initialize](#) ([Entity](#) entity)
Sets parameters of the movement pattern based on the entity's state.
- [Vector3](#) [GetNextPosition](#) ([Entity](#) entity)
Calculates the position of the entity in the next frame.

6.26.1 Detailed Description

Definition at line 11 of file [MovementPattern.cs](#).

6.26.2 Member Function Documentation

6.26.2.1 Initialize()

```
void Initialize (
    Entity entity ) [abstract]
```

Parameters

<i>entity</i>	Entity to adjust the parameters to
---------------	------------------------------------

6.26.2.2 GetNextPosition()

```
Vector3 GetNextPosition (
    Entity entity ) [abstract]
```

Parameters

<i>entity</i>	Entity of which position is calculated
---------------	--

Returns

The calculated position

The documentation for this class was generated from the following file:

- Scripts/MovementPatterns/MovementPattern.cs

6.27 MultiplierPickup Class Reference

Grabbing this pickup increases the score multiplier. The score multiplier is reset by taking damage or by letting the pickup leave the playfield.

Inheritance diagram for MultiplierPickup:

Additional Inherited Members

Public Member Functions inherited from [Entity](#)

- void [SetMovementPattern](#) ([MovementPattern](#) newMovementPattern)
Changes the MovementPattern of the entity.
- void **StartMoving** ()
Tells the entity to start using its MovementPattern.
- void **StopMoving** ()
Tells the entity to stop using its MovementPattern.

Public Attributes inherited from [Pickup](#)

- List< [Reward](#) > **rewards**
List of resources gained by touching the pickup.

Public Attributes inherited from [Entity](#)

- [MovementPattern](#) **movementPattern**
Movement pattern that determines the position of the entity in the next frame.
- string **SpawnKey**
A key to identify the entity among the ObjectPools.

Properties inherited from [Entity](#)

- float **LifeTime** [get]
Time passed since the entity was enabled.
- float **MPLifeTime** [get]
Time passed since the MovementPattern was last set.

6.27.1 Detailed Description

Definition at line 11 of file [MultiplierPickup.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Pickups/MultiplierPickup.cs

6.28 ObjectPool Class Reference

A set of pre-instantiated entities of a specified prefab that can be spawned and despawned by the [ObjectPoolManager](#).

Public Member Functions

- void **Populate** ()
Instantiates objects and adds them to the pool, to fill it up to the `initialPoolSize`.
- void [Enqueue](#) (GameObject obj)
Adds an object to the queue of available objects in the pool.
- GameObject [Extract](#) ()
Retrieves an object from the queue. If the queue is empty, instantiates a new object.

Static Public Member Functions

- static void [SetParentTransform](#) (Transform parentTransform)
Sets a parent transform under which new objects in the pool are instantiated.

Public Attributes

- GameObject **prefab**
Object prefab stored in the pool.
- int **initialPoolSize**
Amount of objects to instantiate when the pool is created.
- int **maxPoolSize**
Maximum amount of objects that can be stored in the pool.

Properties

- string **Key** [get]
A key to the Dictionary of all the [ObjectPools](#) required to extract an entity from the pool

6.28.1 Detailed Description

Definition at line 13 of file [ObjectPool.cs](#).

6.28.2 Member Function Documentation

6.28.2.1 SetParentTransform()

```
static void SetParentTransform (  
    Transform parentTransform ) [static]
```

Parameters

<i>parentTransform</i>	
------------------------	--

Definition at line 56 of file [ObjectPool.cs](#).

6.28.2.2 Enqueue()

```
void Enqueue (
    GameObject obj )
```

Parameters

<i>obj</i>	Added object
------------	--------------

Definition at line 83 of file [ObjectPool.cs](#).

6.28.2.3 Extract()

```
GameObject Extract ( )
```

Returns

Object retrieved from the pool

Exceptions

<i>OperationCanceledException</i>	The maximum amount of objects in the pool has been exceeded
-----------------------------------	---

Definition at line 94 of file [ObjectPool.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/ObjectPool.cs

6.29 ObjectPoolManager Class Reference

Manages spawning and despawning entities from the assigned ObjectPools.

Inherits MonoBehaviour.

Static Public Member Functions

- static GameObject [Spawn](#)< T > (GameObject prefab, Vector3 position, Quaternion rotation)
Activates an entity extracted from a pool in the pool table. Replaces the Entity component of the object from the pool with the from the prefab.
- static GameObject [Despawn](#) (GameObject obj)
Returns an entity back to the pool.

Public Attributes

- List< [ObjectPool](#) > **objectPools**
List of all available ObjectPools.

Static Public Attributes

- static [ObjectPoolManager](#) **Instance**
Singleton instance of the ObjectPoolManager.

6.29.1 Detailed Description

Definition at line 11 of file [ObjectPoolManager.cs](#).

6.29.2 Member Function Documentation

6.29.2.1 [Spawn](#)< T >()

```
static GameObject Spawn< T > (
    GameObject prefab,
    Vector3 position,
    Quaternion rotation ) [static]
```

Parameters

<i>prefab</i>	Entity to be spawned
<i>position</i>	Position at which the entity should be spawned
<i>rotation</i>	Rotation of the spawned entity

Template Parameters

<i>T</i>	Type inheriting from Entity
----------	-----------------------------

Returns

The Spawned Entity

Type Constraints

T : Entity

Definition at line 58 of file [ObjectPoolManager.cs](#).

6.29.2.2 Despawn()

```
static GameObject Despawn (  
    GameObject obj ) [static]
```

Parameters

<i>obj</i>	Entity to be returned
------------	-----------------------

Returns

The returned entity

Definition at line 91 of file [ObjectPoolManager.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/ObjectPoolManager.cs

6.30 OrbitingMP Class Reference

Forms a circular orbit around targeted object.

Inheritance diagram for OrbitingMP:

Private Attributes

- **GameObject target**
Targeted object to orbit around.
- **float radius**
Radius of the orbit.
- **float phase**
Initial position of the entity on the orbit in degrees.
- **float angularSpeed**
Angular speed in degrees per second.
- **float acceleration**
Rate of change of angular speed.

Additional Inherited Members

Public Member Functions inherited from **MovementPattern**

- **void Initialize** (**Entity** entity)
Sets parameters of the movement pattern based on the entity's state.
- **Vector3 GetNextPosition** (**Entity** entity)
Calculates the position of the entity in the next frame.

6.30.1 Detailed Description

Definition at line 12 of file [OrbitingMP.cs](#).

The documentation for this class was generated from the following file:

- [Scripts/MovementPatterns/OrbitingMP.cs](#)

6.31 PanCamera Class Reference

Smoothly pans the camera to a target position.

Inherits MonoBehaviour.

Public Member Functions

- void **PanToPosition** ()
Starts smoothly moving the camera to the target position.

Public Attributes

- Camera **camera**
Camera to pan.
- Vector3 **targetPosition**
Final position of the camera after the pan.
- AnimationCurve **curve**
Portion of the distance travelled by the camera towards the target position over time.

6.31.1 Detailed Description

Definition at line 10 of file [PanCamera.cs](#).

The documentation for this class was generated from the following file:

- Scripts/VFX/PanCamera.cs

6.32 PathCreatorData Class Reference

Stores state data for the path creator editor.

6.32.1 Detailed Description

Definition at line 8 of file [PathCreatorData.cs](#).

The documentation for this class was generated from the following file:

- Tools/PathCreator/Core/Runtime/Objects/PathCreatorData.cs

6.33 PathEditor Class Reference

Editor class for the creation of Bezier and Vertex paths.

Inherits Editor.

6.33.1 Detailed Description

Definition at line 12 of file [PathEditor.cs](#).

The documentation for this class was generated from the following file:

- Tools/PathCreator/Core/Editor/PathEditor.cs

6.34 PausedState Class Reference

State reached pressing the pause button.

Inheritance diagram for PausedState:

Public Attributes

- [PlayingState](#) **playingState**
PlayingState to return to when unpausing.
- PauseMenu **pauseMenu**
Menu to open when pausing.

Additional Inherited Members

Public Member Functions inherited from [GameState](#)

- void **ChangeToThisState** ()
Takes actions needed to define this state.
- void **LeaveThisState** ()
Undoes changes made by this state.

6.34.1 Detailed Description

Definition at line 11 of file [PausedState.cs](#).

The documentation for this class was generated from the following file:

- [Scripts/GameManager/States/PausedState.cs](#)

6.35 Pickup Class Reference

Entity increasing player's resources when picked up.

Inheritance diagram for Pickup:

Classes

- class [Reward](#)
Resources gained by touching the pickup.

Public Attributes

- List< [Reward](#) > **rewards**
List of resources gained by touching the pickup.

Public Attributes inherited from [Entity](#)

- [MovementPattern](#) **movementPattern**
Movement pattern that determines the position of the entity in the next frame.
- string **SpawnKey**
A key to identify the entity among the ObjectPools.

Additional Inherited Members

Public Member Functions inherited from [Entity](#)

- void [SetMovementPattern](#) ([MovementPattern](#) newMovementPattern)
Changes the MovementPattern of the entity.
- void **StartMoving** ()
Tells the entity to start using its MovementPattern.
- void **StopMoving** ()
Tells the entity to stop using its MovementPattern.

Properties inherited from [Entity](#)

- float **LifeTime** [get]
Time passed since the entity was enabled.
- float **MPLifeTime** [get]
Time passed since the MovementPattern was last set.

6.35.1 Detailed Description

Definition at line 11 of file [Pickup.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Pickups/Pickup.cs

6.36 Player Class Reference

Controls player's movement and responses to his actions.

Inherits MonoBehaviour.

Public Member Functions

- void [ChangeBombState](#) (bool state)
Changes bomb state.
- void [ChangeWeapon](#) (float powerLevel)
Changes currently used set of weapons.
- void [ChangeWeapon](#) (int powerLevel)
Changes currently used set of weapons.
- void [ChangeControl](#) ([GameState](#) state)
Changes whether the player has control over the character.

Public Attributes

- float **movementSpeed**
Distance travelled in one second of held movement key.
- float **focusSpeedModifier**
Ratio at which the movement speed is decreased when focused.
- [BombController](#) **bombBehaviour**
Appropriate BombController activated upon deploying a bomb by the player.
- [GameObject](#) **currentWeaponSet**
A set of weapons used by the player at current power level when shooting.
- List< [GameObject](#) > **weaponSets**
List of weapons used at appropriate power levels.

Static Public Attributes

- static [Player](#) **Instance**
Singleton instance of the player.

6.36.1 Detailed Description

Definition at line 13 of file [Player.cs](#).

6.36.2 Member Function Documentation

6.36.2.1 ChangeBombState()

```
void ChangeBombState (  
    bool state )
```

Parameters

<i>state</i>	Whether the bomb effects still last
--------------	-------------------------------------

Definition at line 88 of file [Player.cs](#).

6.36.2.2 ChangeWeapon() [1/2]

```
void ChangeWeapon (
    float powerLevel )
```

Parameters

<i>powerLevel</i>	Player's power level
-------------------	----------------------

Definition at line 97 of file [Player.cs](#).

6.36.2.3 ChangeWeapon() [2/2]

```
void ChangeWeapon (
    int powerLevel )
```

Parameters

<i>powerLevel</i>	Player's power level
-------------------	----------------------

Definition at line 106 of file [Player.cs](#).

6.36.2.4 ChangeControl()

```
void ChangeControl (
    GameState state )
```

Parameters

<i>state</i>	Current GameState of the game
--------------	-------------------------------

Definition at line 117 of file [Player.cs](#).

The documentation for this class was generated from the following file:

- [Scripts/PlayerScripts/Player.cs](#)

6.37 PlayerHitbox Class Reference

Takes responsibility and responses to being hit by enemy objects.

Inherits MonoBehaviour.

Public Member Functions

- void [AttemptHit](#) (GameObject damageSource)
Deals damage to player if they're not invincible.
- void [ChangeBombState](#) (bool state)
Changes bomb state.

Public Attributes

- float **invincibilityTime**
Time window in which the player cannot take damage after taking a hit.
- [GameObjectEvent](#) **onTakesHitEvent**
Invoked when the player takes a hit.

6.37.1 Detailed Description

Definition at line 13 of file [PlayerHitbox.cs](#).

6.37.2 Member Function Documentation

6.37.2.1 AttemptHit()

```
void AttemptHit (  
    GameObject damageSource )
```

Parameters

<i>damageSource</i>	Object causing the damage
---------------------	---------------------------

Definition at line 64 of file [PlayerHitbox.cs](#).

6.37.2.2 ChangeBombState()

```
void ChangeBombState (  
    bool state )
```

Parameters

<i>state</i>	Whether the bomb effects still last
--------------	-------------------------------------

Definition at line 74 of file [PlayerHitbox.cs](#).

The documentation for this class was generated from the following file:

- Scripts/PlayerScripts/PlayerHitbox.cs

6.38 PlayerStatus Class Reference

Records state of player's resources and provides methods to change them.

Inherits MonoBehaviour.

Public Types

- enum [ResourceType](#)
Type of resource maintained by the PlayerStatus.

Public Member Functions

- delegate void **ChangedValueListener** (float value)
Method signature for events that are invoked upon a resource change.
- void **Reset** ()
Sets all resources to their starting values.
- void [ChangeHealth](#) (int amount)
Increases health. If health is already at max, increases score instead. When health reaches 0, invokes GameOver← Event.
- void [ChangeBombs](#) (int amount)
Increases bombs held by a given amount.
- void [ChangePower](#) (int amount)
Increases power and changes power level if POWER_LEVELS requirement is met.
- void [ChangeScore](#) (int amount)
Increases score, rewards extra health if requirement are met.
- void [ChangeScoreMultiplier](#) (int amount)
Changes score multiplier, awards bonus score if max multiplier is reached.
- void **ResetScoreMultiplier** ()
Sets Score Multiplier back to 1.

Static Public Member Functions

- static void [Subscribe](#) ([ResourceType](#) resourceType, [ChangedValueListener](#) listener)
Subscribes a listener to an appropriate resource change event.
- static void [ChangeResource](#) ([ResourceType](#) resourceType, int amount)
Change a resource by a given amount.

Properties

- static [PlayerStatus Instance](#) [get, private set]
Singleton instance of the PlayerStatus.

Events

- static Action **GameOverEvent**
Invoked when the player's health reaches less than 0.

Private Attributes

- int **maxMultiplierScoreBonus** = 100
Score gained for catching Multiplier pickups while at max multiplier.
- int **healthUpRequirementIncrement** = 1000000
Amount of score required to gain extra health.
- int **healthOverflowBonus** = 20000
Score gained for gaining health while already at max health.

6.38.1 Detailed Description

Definition at line 11 of file [PlayerStatus.cs](#).

6.38.2 Member Function Documentation

6.38.2.1 Subscribe()

```
static void Subscribe (  
    ResourceType resourceType,  
    ChangedValueListener listener ) [static]
```

Parameters

<i>resourceType</i>	Type of resource the listener subscribes to
<i>listener</i>	Method that responses to triggering of the appropriate event

Definition at line 125 of file [PlayerStatus.cs](#).

6.38.2.2 ChangeResource()

```
static void ChangeResource (  
    ResourceType resourceType,  
    int amount ) [static]
```

Parameters

<i>resourceType</i>	Resource to change
<i>amount</i>	

Definition at line 138 of file [PlayerStatus.cs](#).

6.38.2.3 ChangeHealth()

```
void ChangeHealth (  
    int amount )
```

Parameters

<i>amount</i>	Amount of health to be changed
---------------	--------------------------------

Definition at line 179 of file [PlayerStatus.cs](#).

6.38.2.4 ChangeBombs()

```
void ChangeBombs (  
    int amount )
```

Parameters

<i>amount</i>	
---------------	--

Definition at line 198 of file [PlayerStatus.cs](#).

6.38.2.5 ChangePower()

```
void ChangePower (  
    int amount )
```

Parameters

<i>amount</i>	Amount of health to be changed
---------------	--------------------------------

Definition at line 209 of file [PlayerStatus.cs](#).

6.38.2.6 ChangeScore()

```
void ChangeScore (  
    int amount )
```

Parameters

<i>amount</i>	
---------------	--

Definition at line 232 of file [PlayerStatus.cs](#).

6.38.2.7 ChangeScoreMultiplier()

```
void ChangeScoreMultiplier (  
    int amount )
```

Parameters

<i>amount</i>	
---------------	--

Definition at line 249 of file [PlayerStatus.cs](#).

The documentation for this class was generated from the following file:

- Scripts/PlayerScripts/PlayerStatus.cs

6.39 PlayingState Class Reference

Default state of the level, when gameplay occurs.

Inheritance diagram for PlayingState:

Additional Inherited Members

Public Member Functions inherited from [GameState](#)

- void **ChangeToThisState** ()
Takes actions needed to define this state.
- void **LeaveThisState** ()
Undoes changes made by this state.

6.39.1 Detailed Description

Definition at line 10 of file [PlayingState.cs](#).

The documentation for this class was generated from the following file:

- [Scripts/GameManager/States/PlayingState.cs](#)

6.40 Projectile Class Reference

An entity whose purpose is to deal damage to enemies or the player.

Inheritance diagram for Projectile:

Public Attributes

- int **damage**
Damage dealt to enemies when owned by the player.

Public Attributes inherited from [Entity](#)

- [MovementPattern](#) **movementPattern**
Movement pattern that determines the position of the entity in the next frame.
- string **SpawnKey**
A key to identify the entity among the ObjectPools.

Additional Inherited Members

Public Member Functions inherited from [Entity](#)

- void [SetMovementPattern](#) ([MovementPattern](#) newMovementPattern)
Changes the MovementPattern of the entity.
- void **StartMoving** ()
Tells the entity to start using its MovementPattern.
- void **StopMoving** ()
Tells the entity to stop using its MovementPattern.

Properties inherited from [Entity](#)

- float **LifeTime** [get]
Time passed since the entity was enabled.
- float **MPLifeTime** [get]
Time passed since the MovementPattern was last set.

6.40.1 Detailed Description

Definition at line 8 of file [Projectile.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Weapons/Projectile.cs

6.41 Pickup.Reward Class Reference

Resources gained by touching the pickup.

Public Attributes

- [PlayerStatus.ResourceType](#) **type**
Type of resource to be gained.
- int **amount**
Amount of resource gained.

6.41.1 Detailed Description

Definition at line 19 of file [Pickup.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Pickups/Pickup.cs

6.42 SaveSystem Class Reference

System for saving and loading object data on local machine.

Static Public Member Functions

- static void [SaveData< T >](#) (T data, string pathSuffix)
Save data to a file.
- static T [LoadData< T >](#) (string pathSuffix)
Loads data from a save file.

6.42.1 Detailed Description

Definition at line 10 of file [SaveSystem.cs](#).

6.42.2 Member Function Documentation

6.42.2.1 SaveData< T >()

```
static void SaveData< T > (  
    T data,  
    string pathSuffix ) [static]
```

Parameters

<i>data</i>	Object of which data are save
<i>pathSuffix</i>	Relative path to resulting save file

Template Parameters

<i>T</i>	Type of the saved object
----------	--------------------------

Definition at line 20 of file [SaveSystem.cs](#).

6.42.2.2 LoadData< T >()

```
static T LoadData< T > (  
    string pathSuffix ) [static]
```

Parameters

<i>pathSuffix</i>	Relative path to save file
-------------------	----------------------------

Template Parameters

<i>T</i>	Type of object to load
----------	------------------------

Returns

Object of specified type with values retrieved from the save file

Exceptions

<i>FileNotFoundException</i>	Specified file path doesn't exist
<i>InvalidDataException</i>	File format on the specified type doesn't match the type T

Definition at line 40 of file [SaveSystem.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Serialization/SaveSystem.cs

6.43 SceneReference Class Reference

A wrapper that provides the means to safely serialize Scene Asset References.

Inherits ISerializationCallbackReceiver.

6.43.1 Detailed Description

Definition at line 34 of file [SceneReference.cs](#).

The documentation for this class was generated from the following file:

- Tools/SceneReference.cs

6.44 ScoreData Class Reference

Serializable data of highest achieved scores.

Public Member Functions

- void [AddScore](#) (int score, string name)
Checks if the score is high enough to be saved and adds it to the array of scores in the correct position. If yes the score at the lowest position will be lost!
- void [AddScoreAndSave](#) (int score, string name)
Checks if the score is high enough to be saved and adds it to the array of scores in the correct position. If yes the score at the lowest position will be lost! Then the data are saved to the scores save file.

Static Public Member Functions

- static [ScoreData LoadScores](#) ()
Loads data from the scores save file. Create a new save file if it doesn't exist.

Public Attributes

- string[] **names** = new string[MAX_SAVED_SCORES]
Setters of the scores sorted by score achieved.
- int[] **sortedScores** = new int[MAX_SAVED_SCORES]
Highest achieved scores sorted from highest to lowest.
- int **savedScoresCount** = 0
Number of saved scores.

6.44.1 Detailed Description

Definition at line 14 of file [ScoreData.cs](#).

6.44.2 Member Function Documentation

6.44.2.1 LoadScores()

```
static ScoreData LoadScores ( ) [static]
```

Returns

Object with values retrieved from the scores save file

Definition at line 47 of file [ScoreData.cs](#).

6.44.2.2 AddScore()

```
void AddScore (
    int score,
    string name )
```

Parameters

<i>score</i>	Score achieved
<i>name</i>	Setter of the score

Definition at line 68 of file [ScoreData.cs](#).

6.44.2.3 AddScoreAndSave()

```
void AddScoreAndSave (
    int score,
    string name )
```

Parameters

<i>score</i>	Achieved score
<i>name</i>	Setter of the score

Definition at line 98 of file [ScoreData.cs](#).

The documentation for this class was generated from the following file:

- [Scripts/Serialization/ScoreData.cs](#)

6.45 SinusoidMP Class Reference

Produces and follows a sine wave shaped path. The sine wave can be rotated by specifying the axis of oscillation.

Inheritance diagram for SinusoidMP:

Private Attributes

- bool **staysInLine**
if true, produces oscillating movement along a straight line, perpendicular to the given axis of oscillation.
- float **speed**
Rate of change of the sine function's argument.
- float **amplitude**
Amplitude of the sine wave.
- float **frequency**
Frequency of the sine wave.
- float **phase**
Phase of the sine wave.
- float **acceleration**
Rate of change of speed.
- float **amplitudeChange**
Rate of change of amplitude.
- float **frequencyChange**
Rate of change of frequency.
- float **phaseShift**
Rate of change of phase.
- float **axisRotation**
Rotation of the axis of oscillation in degrees, where 0 is up.

Additional Inherited Members

Public Member Functions inherited from [MovementPattern](#)

- void [Initialize](#) ([Entity](#) entity)
Sets parameters of the movement pattern based on the entity's state.
- [Vector3](#) [GetNextPosition](#) ([Entity](#) entity)
Calculates the position of the entity in the next frame.

6.45.1 Detailed Description

Definition at line 10 of file [SinusoidMP.cs](#).

The documentation for this class was generated from the following file:

- [Scripts/MovementPatterns/SinusoidMP.cs](#)

6.46 Spin Class Reference

Rotates the object each frame.

Inherits MonoBehaviour.

Public Member Functions

- void **ChangeDirection** ()
Changes the direction of rotation from clockwise to counterclockwise or vice versa.
- void **ChangeSpeed** (float newSpeed)
Sets the angular speed to a new value.

Public Attributes

- float **angularSpeed**
Amount of degrees to rotate per second.

6.46.1 Detailed Description

Definition at line 9 of file [Spin.cs](#).

6.46.2 Member Function Documentation

6.46.2.1 ChangeSpeed()

```
void ChangeSpeed (  
    float newSpeed )
```

Parameters

<i>newSpeed</i>	New value of the angular speed
-----------------	--------------------------------

Definition at line 40 of file [Spin.cs](#).

The documentation for this class was generated from the following file:

- Scripts/Spawnables/Spin.cs

6.47 TextDisplay Class Reference

Tracks a `PlayerStatus` resource and displays it as formatted text.

Inherits `MonoBehaviour`.

Public Attributes

- `PlayerStatus.ResourceType` **trackedResource**
Resource to track and display.
- string **format** = "{0}"
Format of the final string.
- float **defaultValue** = 0
Initial value of the resource.
- bool **hideWhenDefault** = false
Whether to hide the text when the value is the default.
- bool **addSeparators** = false
Whether to add separators between groups of digits.
- int **separatorInterval** = 3
Number of digits between separators.
- int **zeroPadding** = 0
Amount of zeros to pad the value with.

Static Private Attributes

- const float **PREVIEW_VALUE** = 1.23f
Value to be used for previewing in the editor.

6.47.1 Detailed Description

Definition at line 15 of file [TextDisplay.cs](#).

The documentation for this class was generated from the following file:

- `Scripts/UI/TextDisplay.cs`

6.48 UIBar Class Reference

A bar shown during gameplay that displays a resource.

Inherits MonoBehaviour.

Public Member Functions

- void [ChangeMaxValue](#) (int value)
Changes highest displayed value, effectively scaling the bar.

Public Attributes

- [PlayerStatus.ResourceType](#) resourceType
Resource to display.

Private Member Functions

- void [ChangeValue](#) (float value)
Changes the value of the bar.

6.48.1 Detailed Description

Definition at line 11 of file [UIBar.cs](#).

6.48.2 Member Function Documentation

6.48.2.1 ChangeMaxValue()

```
void ChangeMaxValue (  
    int value )
```

Parameters

<i>value</i>	The new highest value of the bar
--------------	----------------------------------

Definition at line 39 of file [UIBar.cs](#).

6.48.2.2 ChangeValue()

```
void ChangeValue (  
    float value ) [private]
```

Parameters

<i>value</i>	The value to be displayed
--------------	---------------------------

Definition at line 51 of file [UIBar.cs](#).

The documentation for this class was generated from the following file:

- Scripts/UI/UIBar.cs

6.49 VertexPath Class Reference

Public Member Functions

- [VertexPath](#) ([BezierPath](#) bezierPath, Transform transform, float maxAngleError=0.3f, float minVertexDst=0)
Splits bezier path into array of vertices along the path.
- [VertexPath](#) ([BezierPath](#) bezierPath, Transform transform, float vertexSpacing)
Splits bezier path into array of vertices along the path.
- Vector3 **GetPointAtDistance** (float dst, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets point on path based on distance travelled.
- Vector3 **GetDirectionAtDistance** (float dst, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets forward direction on path based on distance travelled.
- Vector3 **GetNormalAtDistance** (float dst, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets normal vector on path based on distance travelled.
- Quaternion **GetRotationAtDistance** (float dst, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets a rotation that will orient an object in the direction of the path at this point, with local up point along the path's normal.
- Vector3 **GetPointAtTime** (float t, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets point on path based on 'time' (where 0 is start, and 1 is end of path).
- Vector3 **GetDirection** (float t, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets forward direction on path based on 'time' (where 0 is start, and 1 is end of path).
- Vector3 **GetNormal** (float t, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets normal vector on path based on 'time' (where 0 is start, and 1 is end of path).
- Quaternion **GetRotation** (float t, EndOfPathInstruction endOfPathInstruction=EndOfPathInstruction.Loop)
Gets a rotation that will orient an object in the direction of the path at this point, with local up point along the path's normal.
- Vector3 **GetClosestPointOnPath** (Vector3 worldPoint)
Finds the closest point on the path from any point in the world.
- float **GetClosestTimeOnPath** (Vector3 worldPoint)
Finds the 'time' (0=start of path, 1=end of path) along the path that is closest to the given point.
- float **GetClosestDistanceAlongPath** (Vector3 worldPoint)
Finds the distance along the path that is closest to the given point.

Public Attributes

- readonly float[] **times**
Percentage along the path at each vertex (0 being start of path, and 1 being the end)
- readonly float **length**
Total distance between the vertices of the polyline.
- readonly float[] **cumulativeLengthAtEachVertex**
Total distance from the first vertex up to each vertex in the polyline.
- readonly Bounds **bounds**
Bounding box of the path.
- readonly Vector3 **up**
Equal to (0,0,-1) for 2D paths, and (0,1,0) for XZ paths.

Private Member Functions

- **VertexPath** ([BezierPath](#) bezierPath, [VertexPathUtility.PathSplitData](#) pathSplitData, [Transform](#) transform)
Internal constructor.
- [TimeOnPathData](#) **CalculatePercentOnPathData** (float t, [EndOfPathInstruction](#) endOfPathInstruction)
- [TimeOnPathData](#) **CalculateClosestPointOnPathData** ([Vector3](#) worldPoint)
Calculate time data for closest point on the path from given world point.

6.49.1 Detailed Description

A vertex path is a collection of points (vertices) that lie along a bezier path. This allows one to do things like move at a constant speed along the path, which is not possible with a bezier path directly due to how they're constructed mathematically. This class also provides methods for getting the position along the path at a certain distance or time (where time = 0 is the start of the path, and time = 1 is the end of the path). Other info about the path (tangents, normals, rotation) can also be retrieved in this manner.

6.49.2 Constructor & Destructor Documentation

6.49.2.1 VertexPath() [1/2]

```
VertexPath (
    BezierPath bezierPath,
    Transform transform,
    float maxAngleError = 0::3f,
    float minVertexDst = 0 )
```

param name="maxAngleError">How much can the angle of the path change before a vertex is added. This allows fewer vertices to be generated in straighter sections.

param name="minVertexDst">Vertices won't be added closer together than this distance, regardless of angle error.

Definition at line 48 of file [VertexPath.cs](#).

6.49.2.2 VertexPath() [2/2]

```
VertexPath (
    BezierPath bezierPath,
    Transform transform,
    float vertexSpacing )
```

param name="maxAngleError">How much can the angle of the path change before a vertex is added. This allows fewer vertices to be generated in straighter sections.

param name="minVertexDst">Vertices won't be added closer together than this distance, regardless of angle error.

param name="accuracy">Higher value means the change in angle is checked more frequently.

6.49.3 Member Function Documentation

6.49.3.1 CalculatePercentOnPathData()

```
TimeOnPathData CalculatePercentOnPathData (
    float t,
    EndOfPathInstruction endOfPathInstruction ) [private]
```

For a given value 't' between 0 and 1, calculate the indices of the two vertices before and after t. Also calculate how far t is between those two vertices as a percentage between 0 and 1.

Definition at line 253 of file [VertexPath.cs](#).

- Tools/PathCreator/Core/Runtime/Objects/VertexPath.cs

6.50 Weapon Class Reference

An object responsible for timing and spawning projectiles or other IShootables.

Inherits MonoBehaviour.

Inherited by GatlingGun, and ScatterGun.

Public Attributes

- float **cooldown**
Time between shots in seconds.
- float **chargeTime**
Time between releasing larger set of shots.
- int **bulletsInCharge**
Amount of shots released in quick succession.
- bool **isPlayers**
Whether the weapon is attached to a player.

Protected Member Functions

- virtual void **DetectShootables** ()
Finds all IShootable sources attached to this weapon by searching through its children.
- virtual void **TryShooting** ()
Checks if the weapon can shoot and shoots if it can.
- void **Recharge** ()
Wait for the charge time to pass before shooting again.

Protected Attributes

- float **TimeOfLastShot**
Time of the last shot in seconds.
- int **BulletsShot** = 0
Amount of bullets shot in the current charge.
- List< [IShootable](#) > **GunHeads** = new()
List of IShootable sources attached to this weapon.
- Action **OnShootEvent**
Event invoked when the weapon shoots.

Properties

- bool **HasAggro** = false [get, set]
True if the weapon should shooting in the current frame.

6.50.1 Detailed Description
